

Security Breach Impact Report

Organization: Orion Health Services

Incident Type: Ransomware Attack

Prepared by: Yaqub Wafi Ahmed

Date: 8/25/2026

1. Executive Summary:

Orion Health Services experienced a ransomware attack that began with a phishing email sent to a finance team member, containing a malicious Excel attachment. This incident affected the file server, HR and finance systems, and partially encrypted the backup server. Sensitive information including employee payroll records, patient appointment schedules, and internal system credentials was compromised because of this breach.

2. Attack Vector/Investigation Findings:

- Initial access: Phishing email sent to a finance team member
- Malicious Excel attachment
- Suspicious login from an overseas IP
- Use of Mimikatz for credential harvesting
- Encrypted files with .orionlock extension
- Ransom note appeared on the shared drive

3. Vulnerabilities Exploited:

- The incident began with a successful phishing attack targeting a member of the finance team. The malicious Excel attachment provided the attacker with an initial foothold in Orion Health Services' environment.

Following the initial breach, the use of Mimikatz indicated that the attacker harvested internal credentials. The overseas IP also suggests that the credentials may have been used to access additional systems.

The ransomware spread to the file server, HR, and finance systems, and partially encrypted the backup server. This suggests that there may be possible weaknesses in access controls, credential protection, network segmentation,

and backup isolation. These weaknesses may have allowed the attacker to move beyond the initial compromise and compromise additional data.

- **Possible excessive access or weak segmentation:** Multiple business-critical systems were affected after the initial compromise.
- **Possible backup isolation weakness:** The backup server was reachable and partially encrypted by ransomware.

4. **Business Impact**

Operational Impact: Employees were locked out of file server. HR, finance, and backup infrastructure was disrupted.

Data/Privacy Impact: Employee payroll data, patient appointment information, and initial credentials were compromised.

Financial Impact: Potential costs include system recovery, forensic investigation, downtime, and remediation.

Legal/Reputational Impact: Because Orion handles sensitive healthcare information, the breach may create privacy/compliance concerns and could damage trust among clinics, employees, and patients.

5. **Recommendations:**

1. Isolate compromised systems and investigate remaining malicious activity
2. Reset affected credentials and require MFA where possible
3. Restore systems using verified clean backups
4. Improve phishing/email filtering and employee security awareness
5. Strengthening privileged-access controls
6. Segment critical systems to restrict lateral movement
7. Improve monitoring for suspicious logins and credential-harvesting activities
8. Strengthen backup security and maintain isolated/offline backup copies

6. **Conclusion:**

The ransomware attack caused significant operational disruption and exposed sensitive employee, patient, and authentication information. Orion Health Services should prioritize containment and recovery while strengthening identity security, email defenses, monitoring, network segmentation, and backup resilience.
